WATER MOVEMENT SYSTEMS

PAST & PRESENT
Present Day

Peru has massive rainstorms throughout the year, to prevent flooding of the roads, gutter systems have been built into most roads and along highways.
PRESENT DAY

A large amount of water runs down slopes when it rains and from mountains, systems shown are put in place to control where water flows, and sometimes prevent land slides.
The Inca's designed giant water systems to bring water down through the mountains and irrigate terraces like seen above, at the same time making it beautiful. Most things also have religious meanings. They also built large aqueducts to carry the water miles and miles.
Past

Water was also brought through structures, and even transported through a salt pit to create salt through evaporation.
